- ☐ CW tab tab- hotkey for Console.WriteLine() a line commonly used
- ☐ Keep your solution explorer open Especially on multi-file projects
- ☐ Need to find a file? - right click, go to the bottom, and select view file in solution explorer
- ☐ Ctrl + Z should become your best friend (it works as undo in like every program every)
- ☐ Need to redo something? Use Ctrl + Y or Ctrl Shift Z (again universal to like almost every program)
- ☐ Ctrl + S will save your project, this should become reflexive (I think I've done this in my sleep)
- ☐ Ctrl + F5 will run your project in debug mode, good to do so it won't close immediately
- ☐ <https://stackoverflow.com/questions/5755942/how-do-you-auto-format-code-in-visual-studio>
- ☐ Want to get out of an auto-fill window? Just hit escape
- ☐ Want to change color schemes for Visual Studio? Go to Tools in the top drop down menu. Then select options, under general it should be a drop down box towards the top.
- ☐ Need to auto-format? Do Ctrl + K, then Ctrl + D, this will indent for you, but it would get rid of empty lines
- ☐ Need to update Visual studio? There's two ways: 1) Go to Tools --> Extensions and Updates, and then select any updates 2) Go to Tools ---> Nuget Package Manager and select what you need
- ☐ Want to quickly comment in and out lines of code? Highlight the your line of code and hit CTRL +E, then C to comment out, OR CTRL + E, then U. Alternatively, you can use the buttons to right of your start button (on most versions of VS)
